# The Stone Cech Compactification

**stone-cech compactifications of products** 1) - points, is the stone-cech compactification of certain proper subspaces, yielding a fairly accessible body of nontrivial stone-cech compactifications. finally we shall give several conditions sufficient to insure that a product of pseudo-compact spaces be pseudo-compact, and briefly discuss a related question. 2. **the stone-cech compactification** - **biu** - the stone-cech compactification 1. the space of ultrafilters for brevity, let us fix an infinite set  $x$  throughout this section. definition 1.1.  $\beta x$  is the set of all ultrafilters on  $x$ . we would like to consider the set  $\beta x$  as a topological space, and its elements as points in that space. **the stone-cech compactification, the stone-cech remainder ...** - 3. the stone-cech compactification. the main result of this section is as follows. 3.1. theorem. the stone-cech compactification of a metrizable space is regular wallman. this is a generalization of a result of misra [8]. the idea of the proof of theorem 3.1 is essentially due to misra. indeed, we make use of the following lemmas. 3.2. **the stone-cech compactification of tychono spaces** - the stone-cech compactification of tychono spaces jordan bell jordanll@gmail department of mathematics, university of toronto june 27, 2014 1 completely regular spaces and tychono spaces a topological space  $x$  is said to be completely regular if whenever  $f$  is a nonempty closed set and  $x \notin f$ , there is a continuous function  $f: x \rightarrow [0;1]$  **stone-cech remainders of -spaces** - **biu** - stone-cech compactification if  $x$  is a space and  $f: x \rightarrow \mathbb{R}$  continuous, we call the set  $f^{-1}(0) \cap x$  a zero set of  $x$ . for a  $T_1$  2-space  $x$  the stone-cech compactification of  $x$  (denoted  $\beta x$ ) is that compact space containing  $x$  as a dense subset and that satisfies the condition that disjoint zero sets in  $x$  have disjoint closures in  $\beta x$ . **applications of the stone-cech compactification to free ...** - applications of the stone-cech compactification to free topological groups j. p. l. hardy, sidney a. morris and h. b. thompson abstract. in this note the stone-cech compactification is used to produce short proofs of two theorems on the structure of free topological groups. **algebra in the stone-cech compactification and its ...** - significant portions of my dissertation involved the remainder  $\mathbb{N}^* = \beta \mathbb{N} \setminus \mathbb{N}$  of the stone-cech compactification of the positive integers. in general, the points of the stone-cech compactification of a discrete space  $d$  can be taken to be the ultrafilters on  $d$ , with a point  $x$  of  $d$  identified with the principal ultrafilter  $\{a \subseteq d : x \in a\}$ . **number theory in the stone-cech compactification** - number theory in the stone-cech compactification boris sobot department of mathematics and informatics, faculty of science, novi sad settop 2014 boris sobot (novi sad) number theory in  $n$  august 19th 2014 1 / 12. the stone-cech compactification  $s$ - discrete topological space  $s$ - the set of ultrafilters on  $s$  **the stone-cech compactification and shape dimension** - stone-cech compactification. the techniques and results will likely have wider application in the future. preliminaries the reader is assumed to be familiar with shape theory. the paper by s. mardesic is a good reference [12]. we will only be concerned about compact spaces in this paper, how **local connectedness in the stone-cech compactification** - local connectedness in the stone-cech compactification by mewhenriksen and j. p. isbell introduction this is study of when  $\beta x$  where the stone-cech compactification of completely regular space may be locally connected. as to when, bana-schewski [1] has given strong necessary conditions for  $\beta x$  to be locally connected, and wallace [19] has given necessary and sufficient conditions in **chapter 10 compactifications - washington university in st ...** - 422 c) since  $\beta x$  is locally compact, part b) gives that  $\beta x$  is open in  $\beta \beta x$ , so  $\beta x$  is open in  $\beta \beta x$ . let  $\beta x \setminus x$  be  $\beta x \setminus x$  corollary 2.6 a dense locally compact subspace of a hausdorff space is open in  $\beta \beta x$  proof this follows immediately from part b) of the theorem 2.7 if  $\beta x$  is a locally compact, noncompact hausdorff space, then  $\beta x$  is open in  $\beta \beta x$  **7560 theorems with proofs - auburn university** - 7560 theorems with proofs definition a compactification of a completely regular space  $x$  is a compact  $T_2$ -space  $\tilde{x}$  and a homeomorphic embedding  $f: x \rightarrow \tilde{x}$  such that  $f(x)$  is dense in  $\tilde{x}$ . remark. to explain the separation assumptions in the above definition: we will only be concerned with compactifications which are hausdorff. **compactness and compactification - ucla** - stone-cech compactification  $\beta x$ , (which is the "maximal" compactification, and adds an enormous number of points). the stone-cech compactification  $\beta \mathbb{N}$  of the natural numbers  $\mathbb{N}$  is the space of ultrafilters, which are very useful tools in the more infinitary parts of mathematics.
